

FORTUNA

Fortuna-Cash — Swing

F_cash_swing | Branch B (STK) | v01 | blueprint

The top-view blueprint for long-only NSE cash-equity **swing** trading, horizon **3 days – 3 weeks**. This document fixes the skeleton only — Section 1 (deployable cash) → Section 2 (stock selection: Layer 1 universe+tags → Layer 2 S1■S2 → Layer 3 triggers → merge/rank) → Section 3 (stops / risk / execution). Each layer and strategy is drilled and upgraded in later passes.

Scope: swing only. Long-term (>1yr) holding lives in a sister document, **F_cash_long_term_v01.pdf**. Bull-only — bear candidates are tagged and handed to Fortuna-Options, never traded here (cash shorts cannot be held overnight). Consumes the shared trunk's daily market read (Gate 0), never re-derives it. Open items are marked PENDING.

The Blueprint

The whole plan on one page. Read it top-down as an inverted tree: capital gate at the root, selection in the middle, management at the leaves. Flow order (select → rank → size → manage) differs from section numbering — Section 1 is *first* because 'how much cash is free' gates the day, then it is *applied* again after the ranked list exists.

Bull-only (bears -> Fortuna-Options). Horizon 3 days - 3 weeks. Long-term >1yr = separate doc F_cash_long_term.

The Three Sections

Section	Role	Status in v01
1 . Deployable cash	Starting-state gate: how much capital is free to deploy now; later, split the ranked list into buckets / sizes	Skeleton . real numbers PENDING
2 . Stock selection	The engine: Layer 1 universe+tags -> Layer 2 S1 S2 -> Layer 3 triggers -> merge & rank	Skeleton laid . sub-criteria PENDING
3 . Manage	Per-trade: stop-loss, risk management, buy / sell / exit (dynamic exit lets a live bull run breathe)	Skeleton . rules PENDING

Why Section 1 is first. No free cash = no trade, so the deployable-cash check gates the whole day before any stock is looked at. The *actual* per-bucket allocation happens later, once Section 2 has produced a ranked list — so Section 1 appears at both the root (gate) and after the rank node (apply).

2

Section 2 . Stock selection

Layer 1 universe+tags -> Layer 2 S1 || S2 -> Layer 3 triggers -> rank

Layer 1 . Tradable Universe + Tags

One maintained master list screened from the ~2,000 tradable NSE names, shared by swing and (later) long-term and options. Not static — re-qualified on a cadence, clean IPOs auto-added, failures (lost liquidity / surveillance) dropped. Every name carries tags so downstream strategies just filter the tag rather than re-screening.

Tag	Meaning	Used by
F&O;	Derivatives-eligible (~250 names)	Options branch filters on this - not a separate strategy
Volatility tier	How much the stock moves (ATR-based)	'high-vol only' becomes a filter on S1 or S2
Sector	Sector / industry bucket	S2 lead gate; S1 soft weight
Liquidity	Turnover / delivery / tradability	Hard floor for inclusion on the list

STATUS - PENDING. Universe choice (A Nifty 500 fixed / B F&O core / C property-defined ~300-400) and the exact Layer-1 qualifying criteria (liquidity, price, surveillance thresholds) are the next decision. Live F&O + index lists to be pulled at lock-in (they churn semi-annually).

Layer 2 . Selection Strategies (parallel)

Two genuinely different lenses, run in parallel; their outputs are merged and ranked. Same sector input, opposite role — which is exactly why they are two engines, not one.

Strategy	How it finds candidates	Sector's role
S1 . Stock-first	Technical indicators lead -> stocks starting a bull move	Soft weight (a leader can decouple from a lagging sector)
S2 . Sector-first	Find trending sectors -> then filter by technicals	Lead gate (sector must be trending first)

Bull-only. Both strategies hunt stocks *starting a bull*. Bear-trending names are tagged and passed to Fortuna-Options — never traded in Cash. Merge logic when S1 and S2 surface the same name (confluence bonus vs de-dupe) is a Section-2 sub-detail, PENDING.

Layer 3 . Entry Triggers

These decide **when** to buy, and fire only *after* S1/S2 have already picked the stock — one layer below selection, not parallel to it. Grouped as one category for now.

Trigger	Fires when
Pullback	Strong stock dips to a rising average, then turns up
Breakout	Price pushes above a base / range ceiling on volume
Dip	Short shallow pullback inside an ongoing move
Active	Already-moving momentum names

Then: MERGE + RANK. Union of S1 / S2 survivors that pass a trigger is scored for 'better odds', producing the ranked candidate list that Section 1 (sizing) and Section 3 (management) consume.

Sections 1 & 3 . Stubs

Both are skeleton-only in v01; drilled after Section 2 is fully specified.

Section	What it will hold	Status
1 . Deployable cash	Free-cash check (gate) + capital split into buckets, position sizing, risk-per-trade %, reserve	PENDING numbers
3 . Manage	Stop-loss calc, risk management, buy/sell execution, dynamic exit (let live bull runs extend)	PENDING rules

Sizing frame (indicative, not locked). ~5-8 concurrent positions, ~1-2% of total capital risked per trade with stop-distance setting size, ~20-30% held as reserve. Real numbers are a Section-1 decision, taken later.

F_cash_swing . Tracker

Blueprint status for v01.

Area	Decided	Status
Horizon	Swing 3 days - 3 weeks; long-term = separate doc	LOCKED
Direction	Bull-only; bears -> Fortuna-Options	LOCKED
Section order	1 cash gate . 2 selection . 3 manage	LOCKED
Layer 1	Maintained list + IPO adds; F&O; / vol / sector / liquidity tags	LOCKED (criteria PENDING)
Universe A/B/C	Nifty 500 / F&O; core / property-defined	PENDING
Layer 2	S1 stock-first S2 sector-first, parallel + merge	LOCKED (merge logic PENDING)
Layer 3	Triggers: pullback / breakout / dip / active	LOCKED
Rank node	Score union for better odds -> ranked list	LOCKED
Section 1 numbers	Buckets / sizing / risk %	PENDING
Section 3 rules	Stops / exits / execution	PENDING

Next active step: pick the Layer-1 universe (A/B/C) and its qualifying criteria, so the master list stops being hollow. Everything downstream hangs off that list.
